Art Unit: 2132

The following is an examiner's statement of reasons for allowance:

Applicant has claimed uniquely distinct features in the instant invention which are not found in the prior art, either singularly or in combination. They are:

With respect to claim 1

transferring a data packet of teleconference object data to one or more of the plurality of participants of the electronic conference if the external time is larger than a minimum threshold and smaller than a maximum threshold.

With respect to claim 11

means for transferring a data packet of teleconference object data to one or more of the plurality of participants of the electronic conference if the external time is larger than a minimum threshold and smaller than a maximum threshold.

With respect to claim 18

a transmission circuit for transferring a data packet of teleconference object data to one or more of the plurality of participants of the electronic conference if the external time is larger than a minimum threshold and smaller than a maximum threshold.

With respect to claim 24

two or more computer systems networked together via a communication medium,

Art Unit: 2132

each of the computer systems including a communications manager for communicating via the communication medium, each of the computer systems running an application which shares object data among the two or more computer systems, each of the applications having a background transfer manager which prevents domination by background activities of a CPU of each of the computer systems.

With respect to claim 25

a background transfer manager for transferring as one of the background activities data to the one of more other systems via the communications manager, the background transfer manager preventing domination of the processor by the background activities.

With respect to claim 26

transferring at least one packet of electronic conference object data from a first participant to at least one other participant by employing a background transfer manager (BTM), wherein said transferring is based, at least in part, on a minimum threshold and a maximum threshold.

With respect to claim 35

a storage medium having stored thereon instructions that, when executed, result in a computing platform having the capability to: transfer at least one packet of

Art Unit: 2132

electronic conference object data from a first participant to at least one other participant, said transfer being controlled, at least in part, by a background transfer manager (BTM) and based, at least in part, on a minimum threshold and a maximum threshold.

With respect to claim 42

processing said at least one packet by employing a background transfer manager (BTM);
comparing a variable offset with a substantially predetermined threshold value;
and transmitting an electronic message to said sending participant.

With respect to claim 46

receive at least one packet of electronic conference data from a sending participant; process said at least one packet by employing a background transfer manager (BTM);
compare a variable offset with a substantially predetermined threshold value; and
transmit an electronic message to said sending participant.

These limitations are not found or suggested in the prior art.

It is further noted that new claims 26 –49 do not address the step of “monitoring an external time spend by the CPU”. However, the examiner agrees that this limitation is not necessary to distinguish these claims from the prior art or to make these claims definite.

Art Unit: 2132

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
